Original AM Arctic Monkey's Album:

Define what must match

The brief

Develop a square cover study for Arctic Monkeys' **AM**, anchored in the existing song **"Do I Wanna Know?"** (2013). Keep the minimal black-and-white radio-signal direction. Add typography after developing the artwork. [1]

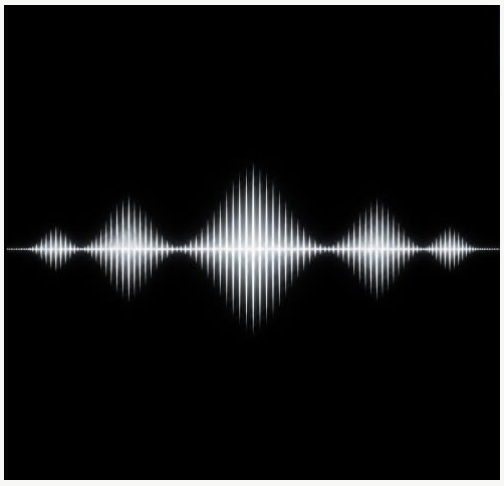

Song, mood, story, and audience

Mood: nocturnal, tense, restrained, hypnotic. **Story:** uncertainty about whether attraction is mutual and the recurring urge to reconnect. **Sound:** a repeating guitar riff, heavy pulse, and layered vocals. **Audience:** indie/alternative-rock listeners who respond to spare graphic imagery. These are working design interpretations; revise them to fit your listening response.

First prompt

> Create an original square album-cover image of a white central graphic single amplitude modulation radio wave form stretched across a black background. Make it minimal, nocturnal, tense, and hypnotic. No text, border, or mockup.

First Result:

Three visible priorities

1. Signal centered at approximately 50% across and 50% down.
2. Signal width about 84%; maximum height about 24% of the canvas.
3. Flat black background, white line, and clear upper/lower 35%.

AESTHETIC DESIGN / 02

Turn visual details into words

Describe five categories

Subject: A single amplitude modulation (AM) radio waveform, A subtle detail at the central part of the wave dips and curves to spell out the letters “AM”.
Composition: span the radio frequency across the horizonal axis 50/50. The radio waveform should occupy 33% of the canvas height and 100% of the canvas width. The first peak of the radio frequency should a maximum of 25% above the horizontal center line and 25% below the horizontal centerline, and should be located 25% across the left side. The second peak of the radio waveform frequency should be a maximum of !0% above the horizontal center line, and 10% below the horizontal centerline, and the midpoint of this peak should 50% across from the left side. The third peak of the radio frequency should a maximum of 25% above the horizontal center line and 25% below the horizontal centerline, and should be located 25% across the right side.
Color: white (#FFFFFF) on black (#000000).
Typography: Keep the top 33% empty for later typography and keep the lower 33% empty as well.
Texture: flat, crisp, and smooth; no glow or grain.

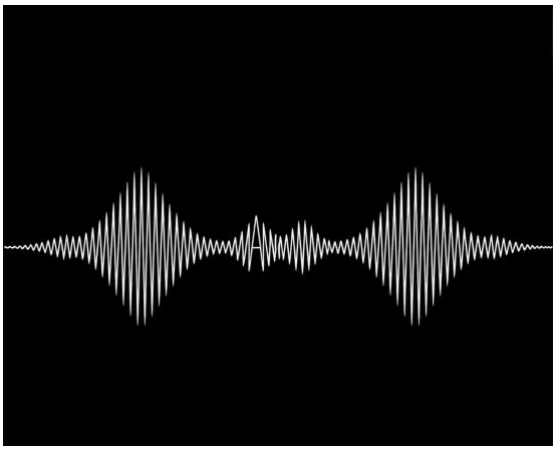

Make the language measurable

“Minimal” becomes one signal with clear empty space. “Centered” becomes a 50% / 50% bounding-box center. “Narrow” becomes a 24% maximum height. These are proposed targets, not measurements of the original cover.

Prompt 2:

> Create one original square album-cover artwork, without lettering. Show one thin, continuous white oscillating amplitude modulation (AM) radio waveform on a flat black background. The radio waveform should occupy 33% of the canvas height and 100% of the canvas width. The first peak of the radio frequency should a maximum of 25% above the horizontal center line and 25% below the horizontal centerline, and should be located 25% across the left side. The second peak of the radio waveform frequency should be a maximum of !0% above the horizontal center line, and 10% below the horizontal centerline, and the midpoint of this peak should 50% across from the left side. with a subtle detail at the central part of the wave dips and curves to spell out the letters “AM” span the radio frequency across the horizonal axis 50/50. The third peak of the radio frequency should a maximum of 25% above the horizontal center line and 25% below the horizontal centerline, and should be located 25% across the right side. Use smooth, evenly weighted curves and crisp edges, with no glow, gradient, grain, scenery, people, or objects. Priority: centered placement, narrow vertical scale, and generous black space. No text, border, or mockup.

Second result:

Check the actual result

What improved? What still differs?

The number of Peaks and oscillations improved but the subtle curved arc, slope, and center peak shape still differs.

Guide AI with references and sketches:

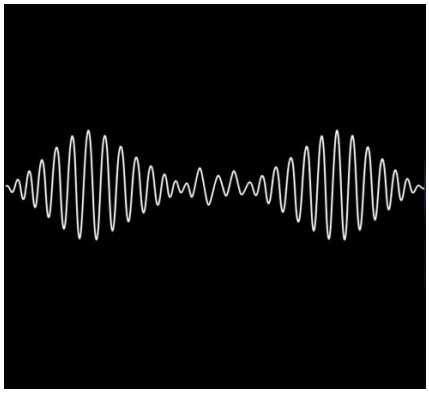

Prompt: Image 1 is an image of an AM radio frequency waveform. follow the slope of this oscillating waveform pattern with its subtle arced shape. Don't carry over Image 1s white background color or red radio frequency color.

Image 1: AM radio wave reference:

Third result:

- Horizontal centerline: Slope = 0 (0°). Left side: Positive slope as the amplitude increases toward the first large peak at 25% of the canvas width, then negative as it decreases.
- Middle section: Smaller, gradually changing slopes around the 50% midpoint.
- Right side: Mirrors the left, with rising and falling slopes around the peak at 75%.

Refine

Recheck the preserved features

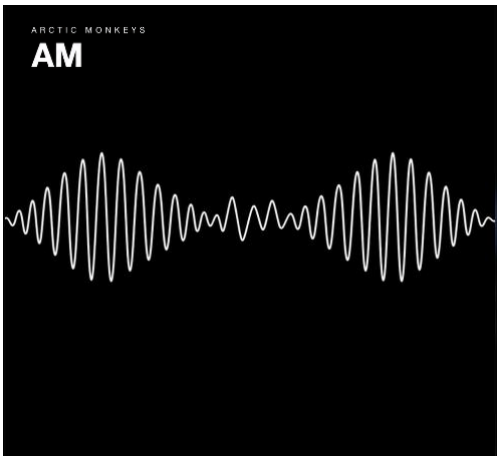

Inspect center, width, line weight, curves, background, and empty space.

AESTHETIC DESIGN / 05

Editable typography / proposed starting values

Canvas: 1200 × 1200 px. **Base margin:** 96 px (8%). **Artist:** ARCTIC MONKEYS, Helvetica / Arial, 26 px, letter spacing 5 px. **Album:** AM, 64 px, tracking 0. **Song:** Do I Wanna Know?, 26 px. Keep type white and separate from the signal. Suggested layout: artist and AM at upper left; song at lower left. Recheck if the font changes.

Final cover and reflection

ARCTIC MONKEYS / AM:
Final Result of album cover:

Short reflection

Explain what worked, the most useful revision, and how the final visual decisions connect to the song. Mention a remaining limitation if relevant. Aim for 60-100 words.

Your reflection

AESTHETIC DESIGN / SUBMISSION

Context and reference:

The original AM artwork is credited to **Matthew Cooper and Alex Turner**. Turner described beginning with a paper sketch and connecting the title to a radio-wave idea. The graphic is associated with amplitude modulation; AM also uses the band's initials. Turner cited the Velvet Underground's *VU* as an influence on the title. Treat the original artwork as a credited reference, and identify your result as an unofficial class study. [2-4]
